# ***HPA axis is responsible for the endogeneous stress response***

CRH receptors are important mediators in the stress response

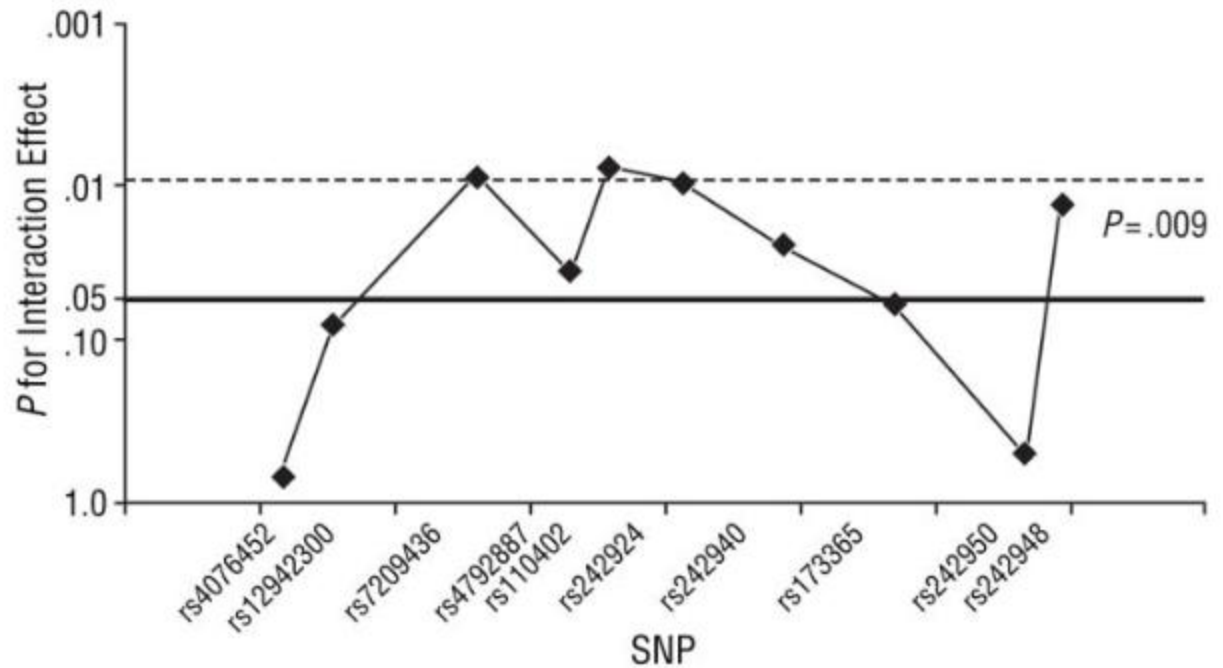

# Influence of Child Abuse on Adult Depression

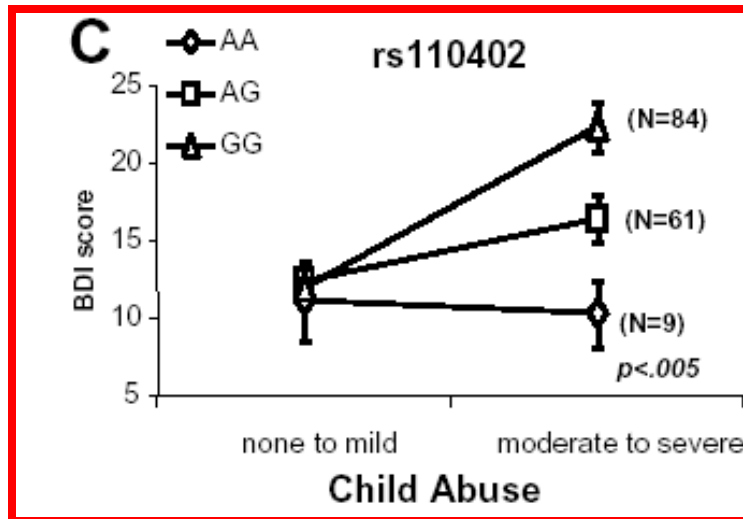

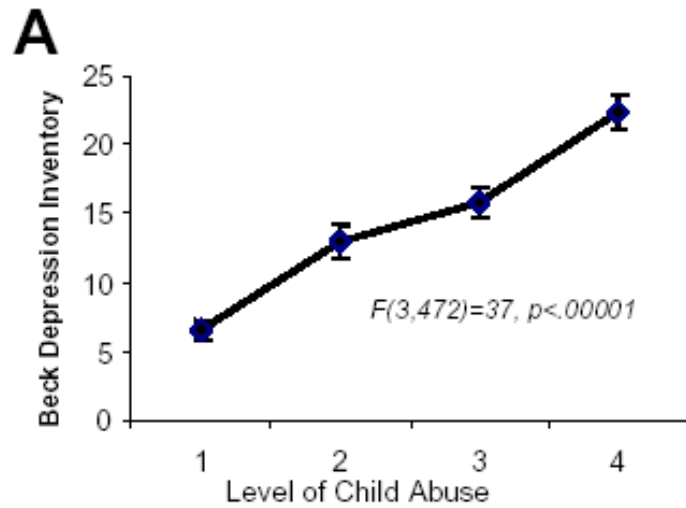

## *Moderation by the Corticotropin-Releasing Hormone Receptor Gene*

Rebekah G. Bradley, PhD; Elisabeth B. Binder, MD, PhD; Michael P. Epstein, PhD; Yilang Tang, PhD; Hemu P. Nair, PhD; Wei Liu, PhD; Charles F. Gillespie, MD, PhD; Tiina Berg, PhD; Mark Evces, PhD; D. Jeffrey Newport, MD; Zachary N. Stowe, MD; Christine M. Heim, PhD; Charles B. Nemeroff, MD, PhD; Ann Schwartz, MD; Joseph F. Cubells, MD, PhD; Kerry J. Ressler, MD, PhD

- Gene X Environment association study of *CRHR1* gene and childhood stress
- Beck Depression Inventory (BDI)
  - 21 items to measure psychological and physical depression symptoms (2 weeks)
  - self-report (completed verbally to account for impaired literacy)
- Child Trauma Questionnaire (CTQ)
  - self report
  - sexual, physical, emotional abuse
  - cutoffs for none, mild, moderate, and severe
- Gene
  - 15 SNPs that span *CRHR1* gene

Polymorphisms moderated the effect of child abuse on risk for adult depression

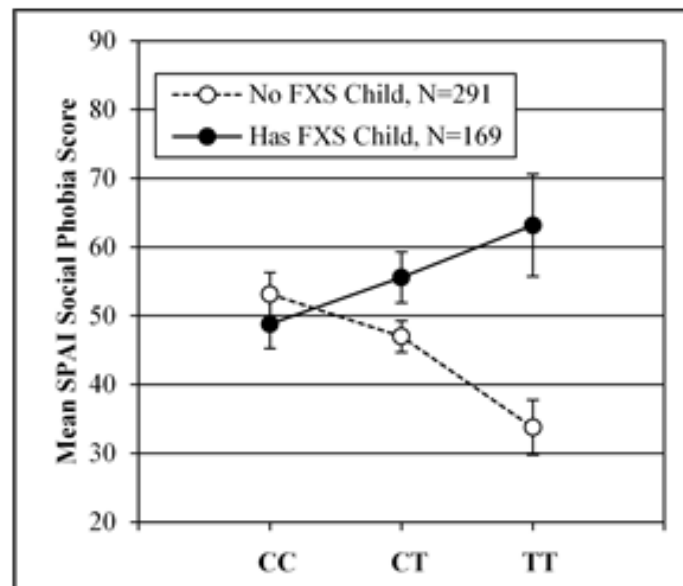

# Depression and Anxiety Symptoms Among Women Who Carry the *FMR1* Premutation: Impact of Raising a Child With Fragile X Syndrome Is Moderated by *CRHR1* Polymorphisms

Jessica Ezzell Hunter,<sup>1</sup> Mary Leslie,<sup>1</sup> Gloria Novak,<sup>1</sup> Debra Hamilton,<sup>1</sup> Lisa Shubeck,<sup>1</sup> Krista Charen,<sup>1</sup> Ann Abramowitz,<sup>2</sup> Michael P. Epstein,<sup>1</sup> Adriana Lori,<sup>1,3</sup> Elisabeth Binder,<sup>1,3</sup> Joseph F. Cubells,<sup>1,3</sup> and Stephanie L. Sherman<sup>1\*</sup>

Having a child with FXS moderates the effect of *CRHR1* SNP rs7209436 genotype to impact the SPAI social phobia score ( $p=0.0001$ ).

## Measures Used:

### Questionnaires

- **Social Phobia and Anxiety Inventory (SPAI)**
- Measures severity of distress associated with social interactions
- To distinguish pure social phobia from distress experienced in social situations due to panic disorder with agoraphobia, we calculated social phobia as: social phobia = social phobia subscale score - agoraphobia subscale score
- **Center for Epidemiologic Studies Depression Scale (CES-D)**
- Self-report questionnaire of depression symptoms in the past week
- **The State-Trait Anxiety Inventory (STAI)**
- State anxiety – current anxiety
- Trait anxiety – general anxiety susceptibility
- Self-report questionnaire
- **The Positive and Negative Affect Schedule (PANAS)**
- Self-report measure of psychological well being within the last year

## ***Is there a subset of premutation carriers who are more vulnerable to effects of stress?***

**Social phobia = CRHR1 + FXS child + (CRHR1 x FXS child) + FMR1 group + covariates**

- main effects not significant for any outcome
- interaction term significant only for SPAI social phobia

*Adjusted p-value  
significance threshold < 0.0037*

## Measures Used:

- **Aberrant Behavior Checklist - Community (ABC-C)**

- Measures inappropriate and maladaptive behavior among individuals with intellectual disability
- 6 subscale scores refactored to be specific to behavior among children with FXS [Sansone et al. 2012 *J Autism Dev Disord* 42(7): 1377-1392]
- Irritability: disruptive and self-injurious behaviors
- Socially Unresponsive/Lethargic: social awareness and response
- Social Avoidance: gaze avoidance, social escape behaviors, and social anxiety
- Stereotypy: repetitive and recurring behavior
- Hyperactivity: elevated activity
- Inappropriate speech: repetitive and disruptive speech
- Total score = Sum of all 6 subscale scores

- **Questionnaire on Resources and Stress – Friedrich short version (QRS-F)**

- Measures stress in families of children with disabilities
- 4 subscales
- Parent and Family Problems: stress related to child with disability on family
- Pessimism: parents' pessimistic beliefs regarding the child's future
- Child Characteristics: child's features associated with demands on parents
- Physical Incapacity: child's ability to perform a range of typical activities
- Total score = Parent and Family Problems subscale score + Pessimism subscale score [Honey et al. 2005 *Autism* 9:246-255]

## ***Is there a subset of premutation carriers who are more vulnerable to effects of stress?***

# No significant interaction for CRHR1 genotype and child's behavior

---

# No significant interaction for CRHR1 genotype and family stress

---

# Summary

- Having a child with FXS –
  - A significant gene by environment interaction was seen with CRHR1 genotypes and having a child with FXS
  - The effect was only detected on SPAI – specific to social phobia
- Could we identify what the stressor was?
  - Among mothers of a child with FXS, no relationships were identified for CRHR1 genotypes and family stress or behavior measures
  - Limitations –
    - Sample size
    - Wrong measures?
